TivaWater 2.0 Filter Assembly Instructions

1. Remove the bag of sand and place it on the ground.
2. Take the black inner bucket out of the blue bucket and gently place it on the lid of the filter (this keeps the black piece clean while completing the assembly).
3. Inside the blue bucket is the gray stand. Remove it.
4. Take the tap (faucet) and push it through the hole from the outside of the blue bucket. Hand tighten the nut/washer from the inside.
5. Set the filter onto the gray stand (the curved part is the front).
6. Set the inner black bucket back inside the outer blue filter.
7. Make sure the black cup is firmly snapped into the bottom of the black inner bucket.
8. Gently pour the sand into the black bucket.
9. Take the filter cloth ring and use two hands to push it into place.
10. Place the lid on top.
11. Pour up to 10 liters into the filter and let it work. On the first flush it will take approximately 20 minutes for water to reach the tap.

Other important information:

- The blue bucket can be washed with soap and clean water before use.
- If the filter stops working, remove the filter cloth and gently stir the top of the sand with your finger. Now scoop out the dirty water on top of the sand. You can refer to our Youtube video for more details on this procedure.
- For the best results, make sure there is always water in the filter.
